A review on Pharmacological potential of Berberine; an active component of Himalayan *Berberis aristata*

Vikas Chander*, J.S. Aswal, Rajendra Dobhal, D.P. Uniyal

ABSTRACT

Plants have been the basis of many traditional medicines throughout the world for thousands of years and continue to provide new remedies to mankind. They are one of the richest sources of compounds. *Berberis aristata* is one of the major plants used in Ayurveda for several remedies. It is used as a tonic, alternative, demulscient, diaphoretic and diuretic, and in the treatment of diarrhoea, jaundice, skin diseases, syphilis, chronic rheumatism and urinary disorders. Scientific evidence suggests its versatile biological functions that support its traditional use in the orient. Phytochemical studies shows that plant *Berberis aristata* contains mainly yellow colored alkaloids Berberine, oxyberberine, berbamine, aromoline, a protoberberine alkaloid karachine, palmatine, oxycanthine and taxilamine and tannins, sugar, starch. Among the several compounds Berberine is main constitute having various pharmacological actions. It is, a benzyloquinoline alkaloid, occurs as an active constituent in numerous medicinal plants and has an array of pharmacological properties. It has been used in Ayurvedic and Chinese medicine for its antimicrobial, antiprotozoal, antidiarrheal and antitrichoma activity. Moreover, several clinical and preclinical studies demonstrate ameliorative effect of berberine against several disorders including metabolic, neurological and cardiological problems. This review provides a summary regarding the pharmacokinetic and pharmacodynamic features of berberine, with a focus on the different mechanisms underlying its multispectrum activity..

Keywords: *Berberis aristata*, Berberine, Medicinal Chemistry, Pharmacology.

INTRODUCTION

Berberine is a plant alkaloid with a long history of medicinal use in both Ayurvedic and Chinese medicine. It is present in *Hydrastis Canadensis* (goldenseal), *Coptis chinensis* (Coptis or goldenthrad), *Berberis aquifolium* (Oregon grape), *Berberis vulgaris* (barberry), and *Berberis aristata* (tree turmeric). The berberine alkaloid can be found in the roots, rhizomes, and stem bark of the plants. Berberine extracts and decoctions have demonstrated significant antimicrobial activity against a variety of organisms including bacteria, viruses, fungi, protozoans, helminths, and chlamydia. In China, berberine is an over-the-counter drug for the treatment of bacterial diarrhea. In 1988, the hypoglycemic effect of berberine was firstly reported when berberine was prescribed to treat diarrhea in diabetic patients¹. Moreover, several clinical and preclinical studies demonstrate ameliorative effect of berberine against several disorders including metabolic, neurological and cardiological problems. This review provides a summary regarding the pharmacokinetic and pharmacodynamic features of berberine, with a focus on the different mechanisms underlying its multispectrum activity. However, numerous literatures had been published by various authors exploring the phytochemical and pharmaceutical aspects along with traditional uses yet there is no much more literature concerning so far the importance of Berberine, which is important constituent of this species.

Ayurveda is a traditional system of medicine using a wide range of modalities to create health and well being. The primary aim of Ayurveda health care is to restore the physical, mental and emotional balance in patients, thereby improving health, preventing disease and treating any current illness. The number of patients seeking alternate and herbal therapy is growing exponentially. Herbal medicines are now in great demand in the developing world for primary healthcare not because they are inexpensive but also for better cultural acceptability, better compatibility with the human body and minimal side effects. Herbal medicine is still the mainstay of about 75–80% of the world population, mainly in the developing countries for primary healthcare². However among the estimated 250,000-400,000 plant species, only 6% have been studied for biological activity, and about 15% have been investigated phyto-chemically. Therefore, it seems necessary to evaluate the herbs properly. *Berberis aristata* DC. (Berberidaceae) is one of the herbs mentioned in all ancient scriptures of Ayurveda, Charaka and

Susruta have mentioned it's different properties along with various used for the treatment of numerous illnesses³. The genus *Berberis* represents the around 12 genera and 600 species worldwide and about 77 species have been reported from India⁴. In Indian Himalayan ecosystem most of the species have reported from Nilgiri hills at an altitude of 1,000–3,000 mASL⁵. Among the various species of *Berberis* genus *Berberis aristata* DC is one of the most important species due to its wide medicinal properties and its occurrence has reported from sub-tropical areas (1800-3000 m ASL) of the mountain state of Uttarakhand and Himachal Pradesh⁶. It is used in various crude drug formulations and in different ayurvedic and homeopathic medicines since ancient times^{7,8}.

It is erect spinous shrub, which is hard, yellowish useable part commonly used in Indian medicine system. The fruits of the species are eaten by inhabitants for curing various diseases. The whole plant is also a good source of dye and tannin which is used for dyeing clothes and for tanning leather⁹. Berberine is main constitute having various pharmacological actions. It is a benzylisoquinoline alkaloid, occurs as an active constituent in numerous medicinal plants and has an array of pharmacological properties. It has been used in Ayurvedic and Chinese medicine for its antimicrobial, antiprotozoal, antidiarrheal and antitrichoma activity. Therefore, in this reviewed article is introduced with the focus of its important ingredient berberine.

Phyto-chemical Examination Study

The plant contains berberine, oxyberberine, berbamine, aromoline, karachine, palmatine, oxyacanthine and taxilamine *Berberis aristata* contains protoberberine and bis isoquinoline type of alkaloid¹⁰. Root of plant *Berberis aristata* contains alkaloids which are berbamine, Berberine, oxycanthine, epiberberine, palmatine, dehydrocaroline, jatrorrhizine, karachine dihyrokarachine, taximaline, oxyberberine, aromoline and columbamine¹¹⁻¹⁵. Four alkaloids, pakistanine, 1-O methyl pakistanine, pseudopalmatine chloride and pseudoberberine chloride were also isolated from *Berberis aristata*^{16,17}. A secobisbenzylisoquinoline or simple isoquinoline alkaloid was isolated from *Berberis aristata*. The major alkaloid found in *Berberis aristata* is Berberine having yield of 2.23% followed by palamatine^{18,19}.

Almost all the parts of different *Berberis* species plants have been explored by various research groups forgetting information on chemotaxonomical identification, variability studies among the same or different plants or species and isolation and identification of various medicinally important chemical constituents from this genus. Although, the constituents reported from stem and roots of the plants were found almost same however, variability has been reported in the chemical constituents of leaves²⁰. Various alkaloids, terpenoids, flavanoids, sterols, anthocyanins, lignans, vitamins, proteins, lipids and carotenoids have been isolated and characterized from different *Berberis* species plants. A numbers of alkaloids have been isolated and identified over the last 60 years across the globe from different *Berberis* species^{21,22}. The chemical constituents isolated from the plants belonging to genus *Berberis* during the last two decades (Year 1991–2012). Alkaloids are the main bioactive chemical constituents of *Berberis* species reported by different researchers. Major alkaloids reported from various *Berberis* species are berberine, berbamine, palmatine, columbamine, jatrorrhizine, oxyacanthine²³⁻²⁵. The berberine and berbamine are the most biologically active compounds widely distributed in almost all *Berberis* species²⁶⁻²⁸. Fourteen isoquinoline alkaloids of aporphine, proaporphine, protoberberine,

protopine, benzylisoquinoline, proaporphine-benzyliso-quinoline and simple isoquinoline have been reported from *B. sibirica* Pall. Pronuciferine N-oxide (1), aproaporphine N-methyl-N-oxide alkaloid are isolated from *B. coletoides* Lechl and identified a new isbenzyltetrahydroisoquinoline alkaloid from *B. tabiensis*^{29,30}. An isoquinoline alkaloid pachycanthine was isolated from the methanolic extract of whole plant of *B. pachyacantha* Koehne³¹. Isolation of lignans from the stem and leaves of plants belonging to genus *Berberis* has also been reported³². Eight phenolic constituents including six lignans, hanultarin, (-)-secoisolaricresinol, (?)-lyoniresinol (?)-syringaresinol, syringaresinol-O-Dglucopyranoside, liriiodendrin, and two phenylpropanoids, 4-glucosyloxy-3-methoxyphenyl trans-propenoic ethyl ester, transferulic acid are reported from the roots of *B. amurensis* Rupr³³. Recently steroid, itesmol 3-O-palmitine has also been isolated from the methanol extract of trunk of *B. koreana* Palib³⁴. Although, most of the phytochemical studies are reported from stem, stem bark, root and root bark of *Berberis* plant however, there are also reports of characterization of phytochemicals from other parts like leaves, fruits and flowers. Phenolic bases are isolated from leaves of *B. integerrima* Bunge³⁵. Various polyphenolic flavonoids like (E) caffeic acid, quercetin, chlorogenic acid; meratin and rutin are reported from the flower extract of *B. aristata* DC³⁶. Chemical constituents present in the fruits of *Berberis* have nutraceutical potential and provide health benefits. Recognizing their potential, many research groups in India are now exploring the phytochemical and pharmacological potential of fruits of different Indian species. Fruits of *B. lycium* Royle (Kasmal) are a good source of various nutrients like anthocyanin, b-carotene, and ascorbic acid and minerals³⁷. Studies done on the five *Berberis* species of West Himalaya of India showed that the fruits contained high content of fiber (pulp 7.0–8.1 %; seeds 4.4–5.3 %), protein (pulp 4.7–7.2 %; seeds 5.9–8.5 %) and fat (pulp 2.6–4.0 %; seeds 4.6–5.3 %) and a good source of minerals, especially Ca and K³⁸. However, they have lower food energy and anti-nutritional factors like tannins and phytic acid. Hence, care should be taken while selecting these fruits for value addition as health food. Many of antioxidants xanthophyll, phenol, carotene are present in the fruits and roots of *B. asiatica* Roxb³⁹. Five aglycones and ten anthocyanins viz. petunidin-3-glucoside, delphinidin-3-glucoside, malvidin-3-glucoside, cyanidin-3-glucoside, petunidin-3-rutinoside, malvidin-3-rutinoside, cyanidin-3-rutinoside, delphinidin-3-rutinoside, peonidin-3-glucoside, and peonidin-3-rutinoside are isolated and identified from the fruits of *B. boliviana* Lechl, a species native to the Pervian Andes⁴⁰. Phenolic compounds rutin and chlorogenic acid are also present in the leaves and fruits of *B. crataegina* DC. Rutin and apigenin 7-O-glucoside were more in fruits whereas, leaves contain more malic acid and citric acid⁴¹.

Berberine is reported as the major active constituent in almost all *Berberis* species. Although it has been reported unanimously by all the research groups that maximum berberine content is accumulated in root part (1.6–4.3 %) in most of the *Berberis* species and low altitude plants contain more berberine in comparison to higher altitude plants⁴²⁻⁴⁴. But, no consistency could be established in the results with respect to species and season⁴⁵⁻⁴⁷. Higher berberine content in *B. asiatica* Roxb (4.3 %) in comparison to *B. lycium* Royle (4.0 %) and *B. aristata* DC (3.8 %) whereas another researcher reported higher content in *B. aristata* DC (2.8 %) in comparison to *B. asiatica* Roxb (2.4 %)^{48,49}. Maximum yield of berberine in the roots (2.76 %) and stem bark (1.76 %) of *B. pseudumbellata* Parker harvested in summer season contrary to this higher berberine content (1.86 %) was reported in the winter samples in the roots of *B. aristata* DC. These variations

may be due to the difference in the species of the plants, location or the analytical techniques used for the analysis.

Structural Activity Relationship (SAR) of Berberine

Importantly it contains a quaternary base Berberine [Natural Yellow 18, 5,6-dihydro-9,10-dimethoxybenzo(g)-1,3-benzodioxolo (5,6-a) quinolininium], a benzyl tetra isoquinoline plant alkaloid present in the roots and bark (figure 1), which is also commercially available as various salts such as berberine chloride and hemisulfate⁵⁰.

Figure 1: Chemical Structure of Berberine

Berberine the main bioactive component present in the plant is known as an AMP-activated protein kinase (AMPK) activator. It is insulin-independent hypoglycaemic. Its effect is related to inhibition of mitochondrial function, stimulation of glycolysis and activation of AMPK pathway and also prevents DNA replication⁵¹. Carbonyl moiety plays a key role in the activity of these compounds and partial reduction of the carbonyl moiety led to inactive dihydroberberine. Modification of the 4-methyl group to a chloromethyl moiety enhanced as well as broadened the antifungal profile of azafluorenones⁵². Substitution at the 8-position in pseudoprotoberberine, especially an n-decyl, could significantly enhance the anti-TB activity. We consider 8-n-decylberberines to be a novel family of anti-tubercular agents with an advantage of inhibiting MDR strains of *M. Tuberculosis*⁵³.

Pharmacokinetics and Pharmacodynamics of Berberine

The plant also contains a number of important phytochemicals, which are alkaloids (proto-berberine, isoquinoline, bisbenzyl-isoquinoline), flavonoids and phenolic acids. It is also important source of folklore medicine system in India⁵⁴. Among several chemical constituents present in the plant, the alkaloid berberine is the main bio-active component in the plant, which has property to lower blood glucose level effectively as the recommended drug metformin⁵⁵. *Berberis aristata*, contains active principle(s) that cause(s) a selective inotropic effect, involving—in the form of the modulatory effect on actin myosin cooperatively—a novel mechanism of action⁵⁶. Berberine metabolized in the liver by cytochrome P450, suffering phase I metabolism and selectively accumulated by mitochondria on K1735-M2 melanoma cells, arresting cell proliferation, causing mitochondrial fragmentation, depolarization, oxidative stress and a decrease in ATP levels⁵⁷. It inhibits the mitochondrial respiration and a decrease on calcium loading capacity through induction of the mitochondrial permeability transition (MPT)⁵⁰. It also inhibits the cholinesterase (ChE) activity and increase glucagon like peptide (GLP1) release and break down the memory molecule acetylcholine, a neurotransmitter that is crucial for the important memory activities of focus and concentration⁵⁸. It has strong potential to regulate glucose homeostasis through decreased gluconeogenesis and oxidative stress and the root extract (250 mg/kg) reduced lipid peroxidation (41.6%)

and protein carbonylation (30.15%), and it also increased the glucokinase and glucose-6-phosphate dehydrogenase activities and decreased glucose-6-phosphatase activity, which play a critical role in glucose homeostasis⁵⁹.

The methanolic extract at the dose of 500 mg/kg (198.2 to 89.7), which was compared to standard anti-diabetic drug Glibenclamide at 0.25 mg/kg dose (201.3 to 102.5)⁶⁰. LD50 of >5000 mg/kg body weight was observed for both ethanolic and aqueous extracts of *B. aristata* in the acute oral toxicity⁶¹.

Mode of Action (MoA) of Berberine

Berberine activated the adenosine monophosphate activated protein kinase (AMPK) and improvement of insulin sensitivity and the mechanism of action of berberine may be associated with promoting regeneration and functional recovery of β -cells⁶². The effect of AMPK activation is stimulation of hepatic fatty acid oxidation and ketogenesis, inhibition of cholesterol synthesis, lipogenesis (the formation of fat), triglyceride synthesis, inhibition of adipocyte lipolysis, stimulation of skeletal muscle fatty acid oxidation, muscle glucose uptake and modulation of insulin secretion by pancreatic beta cells⁶³⁻⁶⁶. Phosphorylation of Thr-172 within the catalytic domain of α subunit (AMPK α) is necessary for AMPK activity. Various studies demonstrate that berberine is a strong inducer for Thr-172 phosphorylation of AMPK. Liver kinase B1 (LKB1) and Ca²⁺-calmodulin-dependent kinase II (CaMKK II) are two major upstream kinases for AMPK activation. Berberine may activate AMPK through increasing AMP/ATP ratio, which is mediated by inhibition of ATP biosynthesis in mitochondria⁵¹.

Ethno-pharmacology

B. aristata DC, the official species of Ayurvedic Pharmacopoeia of India has a niche over reported pharmacological and clinical uses. Attention has been paid to the antioxidant and anti-inflammatory activity of natural products and compounds isolated from natural products which are often characterized by high efficacy and low adverse effects. Berberine is an isoquinoline alkaloid, widely present in different medicinal herbs, especially in the genus *Berberis*. It is mainly used as antidiarrhoeal, antibacterial, antifungal, and antiprotozoal agent. However, current research has also highlighted on its beneficial role in neurodegenerative diseases, mainly due to its powerful antioxidant effect. The therapeutic potential of Berberine in different neurodegenerative diseases such as Alzheimer, Parkinson and Huntington disease has been brought to evidence by numerous studies⁶⁷. According to Ayurvedic pharmacopoeia of India *Berberis aristata* DC is also used in diabetes. Diabetes mellitus is one of the most common chronic diseases and is associated with hyperlipidemia and co-morbidities such as obesity and hypertension. In order to establish scientific facts for the utility of this plant in the treatment of diabetes, the hypoglycemic activity Diabetes mellitus study revealed that it is a heterogeneous metabolic disorder old as mankind and its incidence considered to be high (4-5%) all over world. The use of medicinal plants for the treatment of diabetes mellitus dates back from the Ebers papyrus of about 1550 B.C. A multitude of herbs spices and other plant materials have been described for the treatment of diabetes throughout the world. The medicinal plants might provide a useful source of new oral hypoglycemic compounds for development of pharmaceutical entities or as a dietary adjunct to existing therapies. Few of the plants used for the treatment of diabetes have received scientific or medicinal scrutiny and even the WHO expert committee on diabetes recommends that this area warrant further attention.

Previous studies suggested that hyperglycemia and hyperlipidemia are the common characteristics of streptozotocin induced diabetes mellitus^{68,69}. The maximum reduction in serum glucose levels was seen in methanolic extract of *Berberis aristata* DC at the dose of 500 mg/kg. Hence the methanolic extract of *Berberis aristata* DC had a beneficial effect on carbohydrate metabolism in diabetic condition.

A women's university in India, Shri Padmavathi Mahila Viswavidyalayam Tirupati, conducted a study to evaluate the effectiveness of ayurvedic medicine. They designed a study to provide scientific evidence for the use of *Berberis aristata* in the treatment of urinary troubles caused as a side effect of the anti-cancer chemotherapy drug, cisplatin. Cisplatin is known to cause nephrotoxicity which is a renal disease or dysfunction. In conclusion, the researchers found that the side effects of cisplatin were reversed by the antioxidant properties of the decoction of root bark of *Berberis aristata*⁷⁰. Other research universities in India also studied the medicinal properties of *Berberis aristata* along with effects of berberine as active component in various studies of the anti-diabetic activity of the plant, diabetic rats treated with the ethanol extract of the roots showed a significant reduction of serum glucose level, however, it also showed a significant increase in the level of HDL cholesterol. Additional research must be conducted to determine if the hypolipidemic properties of the plant could serve as a protective mechanism against the development of atherosclerosis (Atherosclerosis; also known as arteriosclerotic vascular disease or ASVD) is a specific form of arteriosclerosis in which an artery wall thickens as a result of invasion and accumulation of white blood cells (WBCs)), which is usually associated with diabetes⁷¹.

Tincture of the root is found to be better than quinine and cinchona as it does not cause cardiac depression in the treatment of intermittent fever and powdered root mixed with butter is used for the treatment of bleeding piles⁷². Its ripe fruits are used as a mild laxative for children and exhibits hypochlolestromic activity⁷³. The leaves for preventing

acetaminophen-induced liver damage and most important clinical use includes treatment of diarrhea due to bacterial, fungal, viral and protozoal infection⁷⁴. Increased levels of calcium and phosphorus in serum and significant decreased in urine are due to the use of *Berberis aristata* aqueous-methanol extract, which possess the potent antiosteoporosis activity and substantiates the ethnic use in treatment of postmenopausal osteoporosis^{75,76}. It also has property to reduce serum cholesterol, triglycerides and low density lipoprotein levels and moreover, there is an increase in thrombin and fibrinogen time⁷⁷.

The traditional Indian and Chinese medicine systems revealed that almost every part of the plant has some significant medicinal value. Its roots, stem, bark, leaves, rhizomes and fruits are used in many classical ayurvedic preparations like Rasaut, Darvyadikvatha, Darvyadileha, Darvyaditaila, Rasanjana, Dasangalepa and in formulations for eye care, wounds, skin diseases, jaundice, rheumatism and diabetes⁷⁸. Traditionally a popular medicine Rasaut, prepared from the root of this plant for eye disorders⁷⁹ and also mixed with honey is useful in the treatment of aphthous sores abrasions and ulcerations of the skin⁸⁰. Different extracts of *B. Aristata* have remarkable antibacterial and antifungal potentials against clinical and standard strains, thus could be used to derive antimicrobial agents especially against *V. cholerae*, *Staphylococcus*, *Candida* and *Aspergillus* species⁸¹. The antimicrobial (minimum inhibitory concentration (MIC)) and minimum athericidal concentration (MBC) against all strains of *Shigella* in both ethanolic and aqueous extract are between 125 to 500 µg/mL and 300 to 600 µg/mL, respectively and MIC & MBC values of berberine are almost comparable to standard ciprofloxacin⁶¹. Its methanolic extract is confirmed to be a potential anticancer herb against colon cancer due to its COX-II inhibitory property on proliferation of human colon cancer cell line (HT29)⁸². The decoction of root bark of *Berberis aristata* use in the treatment of urinary troubles caused as a side effect of the anti-cancer chemotherapy drug, cisplatin⁸³.

Table 2: Ethno-pharmacological activities of the different of *B. Aristata*

Part of the Plant	Ethno-pharmacological/clinical application	References
Fruits	Preventive and curative effects on paracetamol and CCl4 induced hepatotoxicity	84
Root	Anti-platelet activating factor activity	85
Stem, root bark and wood	Protection against ethanol-induced mitochondrial damage	86
Fruit extract	Inotropic effect	87
Root	Antihyperglycemic and antioxidant effect	59
Root bark	Scientific evidence for the folklore use of <i>B. Aristata</i> DC in urinary troubles.	83
Stem bark	Blood glucose lowering potential	88
Root	Anti-diabetic activity	89
Bark	Anti-diarrheal activity	61
Stem	Hypoglycemic and hypolipidemic activity	60
Root	Anti-osteoporotic activity in ovariectomized rats	75
Leaves and Root	Broad spectrum antimicrobial activity for the treatment of ear infections.	90
Root	Potential of thiopentone sodium induced hypnosis in rodents	91
Stem bark	Hypoglycemic activity of aqueous extract in STZ-induced rats	67
Leaves	Used in hepatobiliary Disorders	92

Different types of oral hypoglycemic agents are available along with insulin for the treatment of diabetes mellitus but their long-term use produces undesirable side effects such as skin rashes, transient leucopenia, thrombocytopenia, severe hypoglycemia, and increase chances of cardiovascular death of unknown mechanism. The ethanol extract of root of *B. aristata* 71.42 and 100 mg/kg body weight showed a significant ($P < 0.01$) reduction of serum glucose level in alloxan induced diabetic rats at 15th day as compared to diabetic control group. Cholesterol and triglycerides level were increased very significantly ($P < 0.01$), in diabetic animal when compared with normal control group. The level of cholesterol and triglycerides reduced very significantly ($P < 0.01$), when compared with diabetic control group. The level of HDL cholesterol was significantly ($P < 0.05$) increased in the extract treated group when compared to diabetic control group. In oral glucose tolerance test ethanol extract of *B. aristata* increase the glucose tolerance. It is concluded that the ethanol extract of *B. aristata* possess anti-diabetic activity in alloxan induced diabetic rats. The ethanol extract of *B. aristata* is very promising to develop standardized phytomedicine for diabetes mellitus. *B. aristata* roots showed a significant reduction of serum glucose level, however, it also showed a significant increase in the level of HDL cholesterol and it is very promising to develop standardized phytomedicine for diabetes mellitus⁵⁴. The various ethno-pharmacological activities of different parts of *B. aristata* are in Table 1.

CONCLUSION

Berberis aristata is commonly found throughout India. Review of literatures has revealed that Berberine as active component its use in antimicrobial, hepatoprotective, immunomodulatory, and antidepressant. However not much information is there to prove this plant for anti-neoplastic, anti-fertility, anti-leprotic etc. therefore further studies may be carried out to prove the potential of this plant. The plant is becoming the endangered species now so more work can be done on agricultural and climatic conditions to grow this plant. The translational potential and clues to possible novel bioactivities and novel targets yet to be discovered with this amazing plant species can be gauged from the period. It can be potential source for future drug discovery and drug development.
