History and Traditional uses of Tiryaq (Theriac): An important formulation in Unani medicine

Mohd Aleem*, Md Imran Khan, Mohd Danish, Ajaz Ahmad

ABSTRACT

The history of Tiryaq is around 2000 years old and, since ancient times, has been regarded as a universal antidote. It was a complex compound consisting of many ingredients, originating as a cure for the bite of poisonous wild animals, mad dogs, or wild beasts. Tiryaq was not a usual antidote; it was not developed to cure or prevent a particular disease. It was a multi-medicine to protect against all poisons and treat different conditions, such as chronic cough, stomach-ache, asthma, chest pain, fever, colic, seizures, diarrhoea, and urine retention. The belief that Tiryaq could protect individuals from poisons and various maladies persisted well into the modern era, only gradually being dispelled by the progress of Western medicine founded on scientific principles. Tiryaq was taken off most formularies, although now it survived in India and a few European cities.

Keywords: Tiryaq; Theriac; Antidote; Mithridate; Andromachus; Unani medicine.

1. INTRODUCTION

Since time immemorial, human beings have tried to discover or create a universal antidote that could protect against all poisons, whether derived from plants, animals, or minerals. Such therapy was a particular preoccupation of powerful rulers and the affluent; fear of poisoning and a desire to purchase antidote motivated both groups [1]. Among speakers of Arabic, the elusive elixir came to us as a “Tiryaq / Theriac” (English: treacle; Latin: theriaca; French: thériaque; Unani: Tiryaq), a word derived from the ancient Greek word therē; “wild animal” or theriadatheriakos; “wild beasts” [1–3]. According to some authors, the word theria is derived from the verse of Nicandre of Colophon, which is referred to as Theriaca. In Old English, called treacle, meaning the golden syrup that is drained during sugar refining [4]. Tiryaq refers to a combination of drugs, originating as a cure for the bite of poisonous wild animals, mad dogs, or wild beasts [2–5]. However, the Tiryaq was not a usual antidote; it was not developed to cure or prevent a particular disease. It was a multi-medicine to protect against all poisons and treat different conditions, such as chronic cough, stomach-ache, asthma, chest pain, fever, colic, seizures, diarrhoea, and urine retention [1–3]. The primary role of Tiryaq has to neutralize the effects of toxic substances on the body. It could be used in reaction to an event of poisoning and routinely to create ‘immunity,’ and it was only a quick step from inventing a general solution to declaring a cure-all [6].

2. MATERIAL AND METHODS

The information on Tiryaq was obtained from online databases, including PubMed, Google Scholar, Science Direct, and a library search was conducted from classical Unani textbooks. The keywords used for the search were: Tiryaq, theriac, theriaca, treacle. This review mainly focuses on the history of Tiryaq and its traditional uses and provides a platform for future research perspectives.

3. HISTORY OF TIRYAQ / THERIAC

The notion of a universal antidote to counteract all venoms was ancient and can be found in many medical treatises [7]. In Greek mythology, the goddess of healing, Panacea, was said to have a potion that cured any illness. The quest for the cure-all remedy would continue throughout ancient times as physicians tried out innumerable cures in their patients’ regular care, particularly in desperate circumstances. In the ancient world, poisoning was fairly common and the pursuit of a toxin-protective compound led to fame [7]. The invention of Tiryaq is also attributed by many to Mithridates VI Eupator, king of Pontus in Asia Minor (120-63 B.C.). It was a skilful ruler but a monster of cruelty, who, living in such a fear of being poisoned, experimented extensively with poisons and their antidotes on condemned criminals and slaves, and hoped to the creation of a universal antidote. Finally, he created a universal antidote called the mithridatum or mithridatium “mother of all antidotes” [1, 4, 5]. It contained around forty ingredients, such as opium, saffron, castor, myrrh, cinnamon, ginger, and was thought to protect against all animal venom and other toxins [1, 2]. He tried to vaccinate himself by drinking a daily dose of poison and an antidote to protect himself...
against the fear of poisoning. In the first century AD, Nero's physician Andromachus took a great deal of mithridatium ingredients and produced a new antidote. Andromachus came from the island of Crete, where herbs were gathered by "botanical persons" in the service of the Emperor and placed in knitted pots, which were sent not only to Rome but also to other countries. The vast knowledge of botany by Andromachus helped him "provide the requisite medicines for mankind." He retained almost the majority of the simple ones, such as the opium, but about a dozen new simples have been added. The most important alteration of Andromachus to Mithridatium antidote was the replacement of an African lizard, called skink, for the viper, and create a new antidote: the TyrhaqThearic. He named his medication "Tranquility." It was thought to be effective against snakes and other poisonous animal bites. It was a general antidote to venoms and contamination and was used as a curative and preventive for all sorts of general ailments. Andromachus says that his Tyrhaq can not only be used for toxic animal bites, but also used in asthma, colic, dropsy, inflammation, and plague. Andromachus Tyrhaq's performance elevated him to the dignity of chief physician and for centuries preparation has enjoyed a considerable reputation. The two recipes differed to some extent in the kind and quantity of plant drugs and the opium content. Among its sixty-odd ingredients, Tyrhaq contained Bitumen and Lennian earth, all lacking in mithridatium, while lizard was a distinctive ingredient in mithridatium; both remedies had castoreum, a substance derived from the perineal glands of the beaver. The initial reference of Tyrhaq can be found in the educative poems from the second century B.C., "Theriaca et Alexipharmaca" by the Greek grammarian, poet, and physician Nicander of Colophon, who defined several toxins and their antidotes from animal bites. One of the earliest Tyrhaq formulations against venom bites was engraved on a stone in the Temple of Asclepius on Cos Island. According to Pliny (23-79 AD) and Jalinoos (Galen) (131-c.201 A.D.); it included thyme, sweet myrrh, aniseed, fennel, and parsley. In the books "De Antidotis I," "De Antidotis II," and "De Theriaca ad Pisonem," Jalinoos inscribed about several Tyrhaq compounds, but his favourite was the "Tyrhaq of Andromachus." This preparation was compounded by Jalinoos for the Emperor, Marcus Aurelius Antoninus (121-80), who has taken a standard dose for poison safety and wellbeing. After Jalinoos, medicine entered a time of minimal advancement, and the "Tyrhaq of Andromachus" with his blessing retained a privileged Tyrhaq status. The fundamental formula as it existed over the centuries was very consistent. "Tyrhaq of Andromachus" was required to mature for years and was administered orally as a potion or topically in plaster. Jalinoos believed that his Tyrhaq had drawn poisons like a cupping glass and could divide the tide of the abscess faster than the scalpel. Jalinoos did not just administer his Tyrhaq on humans, but he also tested it on animals. In "De Theriaca ad Pisonem," he explains how he took the roosters and split them into two groups: in one group, he gave the Tyrhaq, and in the other group, he did not. Then he made contact with the snakes of both classes; he noticed that immediately after being bitten, the roosters who had not been given the Tyrhaq died, while those who had been given the Tyrhaq survived. In addition, he points out that this experiment may be used in situations where someone needs to make sure that a Tyrhaq is in its natural state or has been adulterated. In addition to this work, Jalinoos wrote about the effects of his Tyrhaq on individual patients. In one passage in "De Theriaca ad Pisonem," he provides an illuminating justification of the use of his Tyrhaq to treat the jaundice caused by snakebite. In mediaeval Europe, Tyrhaq's preparations appeared in the 'Lorscher Arzneibuch' as early as the eighth century. Initially formulated counter poisons, both Tyrhaq and Mithridatium, have been commonly used as panaceas in the early modern period. In the 12th century, the most famous and expensive Tyrhaq in Europe was Venice (the capital of northern Italy). Venice had been considered to have the first standard of "Andromachus Tyrhaq." In 1602, George Bartisch (1535–1607), the popular German ophthalmologist, published a booklet on Venice's Tyrhaq of Andromachus, a well-known cure-all. Every year, a religious and medical festival was held there to prepare the authentic Tyrhaq. When prepared, the mixture was a very soupy combination and placed in a cool, dry place to mature. Seven years was a typical time to wait until Tyrhaq was used. Subsequently, various forms of Tyrhaq were developed in antiquity, but Andromachus may have invented the most celebrated. This popular electuarium became a patent medicine in the Middle Ages and entered legal dispensaries and pharmacopoeias. It is noticeable also in the 19th century French and German pharmacopoeias. Tyrhaq was taken off most formularies, although now it survived in India and a few European cities.

4. TRADITIONAL USES

The history of Tyrhaq is around 2000 years old and, since ancient times, has been regarded as a universal antidote. By the time the entire region adopted Islam, Tyrhaq was part of a long-standing Persian medical tradition, and physicians used them. The passage of knowledge on the Tyrhaq of the European culture to Islamic culture has come true quite early by Alexandria, where many doctors were interested in poisons. Tyrhaq, regarded as a universal cure since ancient times, was a complex compound made up of several ingredients, wherein the substances that give the name to the combination represent the primary constituents of each Tyrhaq and are mixed with a plethora of other elements. All the Tyrhaq share similar properties and are mainly antidotes to poisons and treat diseases. Tyrhaq is appropriate for all things that the great Tyrhaq is chiefly recommended in helping the disorders of the liver, kidney, stomach, intestines, gout, colic, bladder, skin, thinness, and falling of hair, and to counteract a variety of poisons and infections resulting from animal bites. Jalinoos writes that it is also useful against chronic headaches, dizziness, and hearing loss. Ibn Sina (Avicenna) (980-1037) appears to have believed that the Tyrhaq proved effective in counteracting poisons and can improve sensual perception, increase sexual desire, stop bleeding, facilitate the kidneys and bladder's work, and stimulate the appetite.

Ismail Jurjani (Zayn al-Din Gorgani) (1040–1136) repeatedly referred to various types of Tyrhaq and their medical properties in the eastern Muslim world. In Zakhiro Khwarazmshahi (Thesaurus of the Shah of Khwarazm), he described Tyrhaq as having the power to treat various poisons and relieve all pain, plague, epilepsy, vertigo, toothache. Sometimes it strengthens the sense of taste. It also helps those who have difficulty breathing as a thick phlegm builds up in the hollows of the lungs and prevents a man from breathing. In the plague, Tyrhaq was used as both a preventive and therapeutic drug. Itnobly cures the jaundice caused by a liver-related disease. It breaks down kidney stones and removes the earthy and foul matter; it heals bladder wounds and cures dyspepsia and weakness in the guts and warms the stomach body and strengthens it. Abū Bakr Muhammad ibn Zakariyya al-Rāzı (854–925) cited Jalinoos that a Tyrhaq may counteract snake venom and all other poisons. Abū Rayhan Birānī (973–1050) made many references to the properties and types of Tyrhaq. William Turner, in his ‘Book of Wines’ quoting Jalinoos, that with the use of Tyrhaq, I have most times helped those that had the disease called leprosy. It is suitable for the body and the mind.
Abū Marwān ʿAbd al-Malik ibn Zuhr (Avenzoar) (1094–1162) wrote of making a Tiryaq for Al-Andalus’s ruler that included saffron. In 1360, Al-Kuhin al-ʿAtar al-Isra’ili al-Haruni, described a new Tiryaq in a “Minhaj al-Dakkān wa-Dustur al-Aʿyan fī l-tībb wa-l-sayyadalāh” (The Management of [Apothecary] and Regulations of Important Matters in Medicine and Pharmaceutics), consisting of 86 components. When dissolved in water and taken with honey, he claimed this mixture counteracted poisons, treating respiratory, stomach conditions, chest pains, and colic [1]. Abū Al-Wālīd Muhammad Ibn ʿAbd al-Rašīd (Averroes or Aver Ruiz or Averhoes) (1126–1198 A.D) examined the nature, quality, and utilization of Tiryaq as an antidote of poisons or venoms and as a treatment of several diseases [14]. He also wrote a book on Tiryaq “Maqaṣa fī l-Tiryaq” (Treatise on Theriac) [14]. Till the sixteenth century, no remedy could be more beneficial for humankind than the Tiryaq antidote [1]. Tiryaq was considered the most powerful of all the conventional antitoxins [7]. Different types of Tiryaq and its traditional uses are mentioned in Table 1.

### 5. CONCLUSION

Tiryaq has been one of the most popular medicines since ancient times. The medicine could almost cure any kind of disorder, and the stone of the philosopher, the elixir of life and rejuvenation. From ancient times until the sixteenth century, it was known by most naturalists, doctors, and pharmacists as the most perfect and effective antidote of all antidotes. However, it has been very controversial since its invention to our time and is supported by the eminent authority accorded to Unani medicine. The belief that Tiryaq could protect individuals from poisons and various maladies persisted well into the modern era, only gradually being dispelled by the progress of Western medicine founded on scientific principles. So scientific studies and clinical trials are needed on these compound formulations to ensure its scientific validation.
